Dennis Weigelt Pedersen her fra Innovationscenter for Økologisk Landbrug har været på besøg hos det økologiske landbrug Nordic Hemp på Mors for at lave et udviklingsstjek.

Her så de bl.a. på dyrkningsmetoder, typer af afgrøder, jordtyper og sædskifte - samt fordele og ulemper ved pløjfri dyrkning i forhold til at drive et økologisk landbrug.

Besøget var en del af vores tilbud om gratis udviklingsstjek til økologiske landmænd i 2023: <https://lnkd.in/g/b2zofljq>

Projektet er støttet af Fonden for økologisk landbrug.

Pat on the back for Nordic Hemp from the Innovation Center for Organic Agriculture. 🌱 🌿 🌾

We recently had a visit from Dennis Weigelt Pedersen from the Innovation Center for Organic Agriculture. As the devil's advocate, he was out to inspect the polyculture field, which this year offers gluten-free organic oats under-sown with white clover and ryegrass. With furrowed brows and a sharp gaze, he looked closely at the crops and inspected the soil type, but a moment later his face lit up in a smile and we started talking 🌱 🌿 🌾

The visit lasted about an hour and a half, during which cultivation methods, types of crops and crop rotation were evaluated. I focused on soil types in Denmark and perspectives on soil types on other continents, e.g. U.S.A and of course Venezuela. 🌱 🌿 🌾

It was particularly important for us to evaluate the advantages and disadvantages of no-plough cultivation in relation to running an organic farm. 🌱

Damaging the soil structure as little as possible, including earthworms, the environment for microorganisms and mycelium, and adding more resources to the soil than we take. 🌱 🌿 🌾

The visit ended with a warm pat on the back and a few words of recognition - Dennis believes that we are doing the right thing and are heading in a good direction. 🌱 🌿 🌾

Let's see... a lot can happen over the summer in terms of sun, wind and weather. 🌱 🌿 🌾

Soil we have initially created good conditions for the crops. Among others establishing a polyculture in the spring that over time provides nitrogen, nutrition, ground cover and optimises the conditions for moisture supply to the plants. 🌱 🌿 🌾
