The right partner for you in international projects

The Innovation Centre for Organic Farming would like to collaborate with you on your work with the strategic sector cooperation with authorities and organizations in the countries, where you have projects relating to food, agriculture and agro-ecology as a focus.

As a starting point, we have a wide range of expertise within organic and sustainable agriculture, which supports many of the Global Goals (SDGs) 2, 3, 6, 8, 12, 13 and 15, which most countries around the world also have as goal posts for development.

Denmark's and Danish society's focus on agro-ecological cultivation methods and sustainability is well-known in the world, and we must take advantage of that.

The Innovation Centre for Organic Farming is an independent, non-profit knowledge and research organization that work holistically and interdisciplinary based on the four global ecological principles of health, ecology, fairness and care, as well as the UN's 17 global goals for sustainable development.

We can offer expertise ranging from conversion and regulation of organic farms, dissemination of the organic value base and knowledge transfer in farmer learning groups – and more specific areas like plant production, animal husbandry, food technology, disease prevention and cooperation with a range of private companies. We have extensive knowledge and long-term experience in working interdisciplinary with many different types of organizations, units, ministries, public institutions, private companies and partnerships both in Denmark and internationally.

Our partners include SEGES Innovation, Organic Denmark and the national association Food & Agriculture, which are the relevant interest organizations for companies and primary producers.

As a consequence of the construction of our organization, questions or tasks concerning organic agriculture should be directed from SEGES Innovation to us. It works perfectly on a daily basis, as we have several common activities and interests.

We already have an active part of the Indonesian SSC-project on the development of the organic milk sector. We contribute with programs for training and providing knowledge and understanding of the core values in organic farming.

We collect, develop and disseminate new knowledge and new solutions, and we carry out research and development through experiments and demonstrations with farmers. We are the link between theory and practice and support organic farmers in running their farms in the best possible way and in taking the lead, when it comes to innovation and green development.

We are focused on agro-ecology and organic production methods, green growth, rural development, sustainable development and being at the forefront of solutions for

a balanced planet – in terms of climate, nature, animal welfare and the circulation of resources. With agro-ecological cultivation methods we also protect drinking water and the local environment and promote and protect biodiversity in the cultivated land.

We focus both on sustainability in general, but also on a sustainable economic development for our partners. We can contribute with knowledge about organic farming to your strategic sector collaborations and the green agenda - i.a. with an increased focus on the optimization

of resources and nutrients as well as handling diseases and antibiotic resistance. In doing so, we also support WHO's One Health strategy, including animal health and the fight against antibiotic resistance.

Our knowledge and expertise in combating livestock diseases together with producers and authorities is comprehensive. We are experts in directly getting primary producers to understand and work with the right strategies focusing on proven agro-ecological methods.

Presentations, webinars, workshops and courses

We would like to be one of your preferred partners in agro-ecology and sustainable development within food and agriculture. We can communicate directly with your business partners, as we have experts that speak different languages.

In addition to participating in future projects, we can also offer you and your partners a wide range of presentations, webinars and workshops. They can be anything from half an hour to 2-3 hours or a longer course.

The content can be tailored to your wishes and needs.

Here are a few examples:

- Organic principles and the benefits for society in general
- The public/private partnerships within the organic sector in Denmark and the collaboration with research institutions
- Economic and environmental benefits in using agro-ecological methods
- Organic and holistic approach and methods for combating exotic diseases and the spread of diseases
- Economic benefits for producers in using agro-ecological methods
- Environmental benefits for society with a strong and pesticide-free agricultural sector
